SECTION 1 - INTRODUCTION

Enchanted Rock LLC (Enchanted Rock) is providing this initial compliance stack test report to the Texas Commission on Environmental Quality (TCEQ) to demonstrate the Unit01 generator (CHP-01) is meeting the emission rates in its permit and those required under Chapter 117. Enchanted Rock is submitting this report pursuant to the requirements in Texas Administrative Code Title 30 (30 TAC), Chapter 117, Subchapter D, Division 1.

1.1 Facility Information

Enchanted Rock operates the Childrens Health Plano - EGUs Plant (CHP) in Plano, Collin County, Texas. The CHP site is located at 7601 Preston Rd. The commercial operating date for CHP-01 was 12/9/2025. CHP-01 is a natural gas-fired electric generator that is rated at 400 kWe for continuous power operations. Although rated for continuous operation, the generator will typically operate for approximately 500 hours per year. The engine is equipped with non-selective catalytic reduction (NSCR) control technology and an automated air-to-fuel ratio controller which operates the rich burn engine at near stoichiometric conditions. The initial emissions test is being conducted for nitrogen oxides (NO_x), oxygen (O₂) and carbon monoxide (CO) emissions as required in 30 TAC 117.2135(d).

Enchanted Rock conducted the initial compliance testing on CHP-01 on 2/4/2026. The following personnel were present for the testing: Mr. Eric Knox, Microgrid Emissions Technician.

Figure 1-1 provides a schematic drawing of the genset tested, and Figure 1-2 depicts the testing apparatus and the generator emission points.

1.2 Responsible Official

Enchanted Rock completed the initial compliance test in-house. Any questions or communication regarding this test report should be directed to the following Enchanted Rock representative:

1.3 Emissions Summary

Table 1-1 presents a summary of the emission rates sampled during the initial compliance test on CHP-01. The results demonstrate that the engine is well below the applicable emission rates in 30 TAC §117.2110. No changes have been made to the unit since the compliance test was conducted which could result in a significant change in NO_x emissions.

1.4 Test Report Contents

This application is organized into the following sections:

- Section 2 provides a description of the facility tested, the portable emissions analyzer testing apparatus and the test methods used.
- Section 3 discusses the emission calculation procedure and test results.
- Appendix A contains the pre-test and post-test calibration and drift reports.
- Appendix B contains the raw test data collected for the test runs.
- Appendix C contains the calibration-corrected raw test data.
- Appendix D contains a brief resume/qualifications of the test personnel.
- Appendix E contains the analyzer stability check.

SECTION 2 - SAMPLING PROCEDURE

The CHP Plant is an electric generating power plant that burns natural gas in spark ignition reciprocating engines to produce electricity. The Plant operates as a peaking power plant, and also provides backup power to its customer facility located adjacent to the Plant.

2.1 Emissions Analyzer

Enchanted Rock utilized the Testo 350 emissions analyzer for this test. The Testo 350 meets the requirements of EPA CTM-030, EPA CTM-034, and ASTM D-6522 testing protocols for portable emissions analyzers. Figure 2-1 presents the gas path diagram depicting the basic process description outlined below.

Exhaust gases are sampled via a dual probe stainless steel shepherds hook, connected to the Testo 350 sampling probe. The Testo 350 main pump draws a steady flow of gas through the peltier cooler to remove moisture and particulate filter before being introduced to the NO and NO₂ electrochemical cells. The gas is simultaneously sent through a NO_x/SO_x filter before being sent to the CO cell. The measured emissions are recorded every 15 seconds.

2.2 Emissions Test Procedure

The initial compliance test consists of six 30-minute test cycles. The emissions test cycle follows the ASTM D-6522 method for portable emissions analyzers, which is briefly outlined below.

The technician arrives onsite and assembles the sample line to the analyzer and sample probe/shepherd's hook, and then allows the analyzer to sample fresh air for 15 minutes during a warm-up period.

After the warm-up period is complete, the pre-test calibration is conducted. This calibration is performed for CO, NO, NO₂, and O₂ and includes:

1. Verifying the zero-response reading for each compound is zero. For oxygen, this is accomplished during either the NO or CO calibration steps, as both calibration gases have 0% O₂. This step also verifies that the system does not have any leaks.
2. Verifying the analyzer accurately measures each compound by sampling each EPA Protocol calibration gas. The analyzer may be calibrated as necessary to reflect the calibration gas concentration.
3. Purging the analyzer following each calibration until the concentration is below 10 ppm for the previous calibration gas. This usually takes between 3-5 minutes.

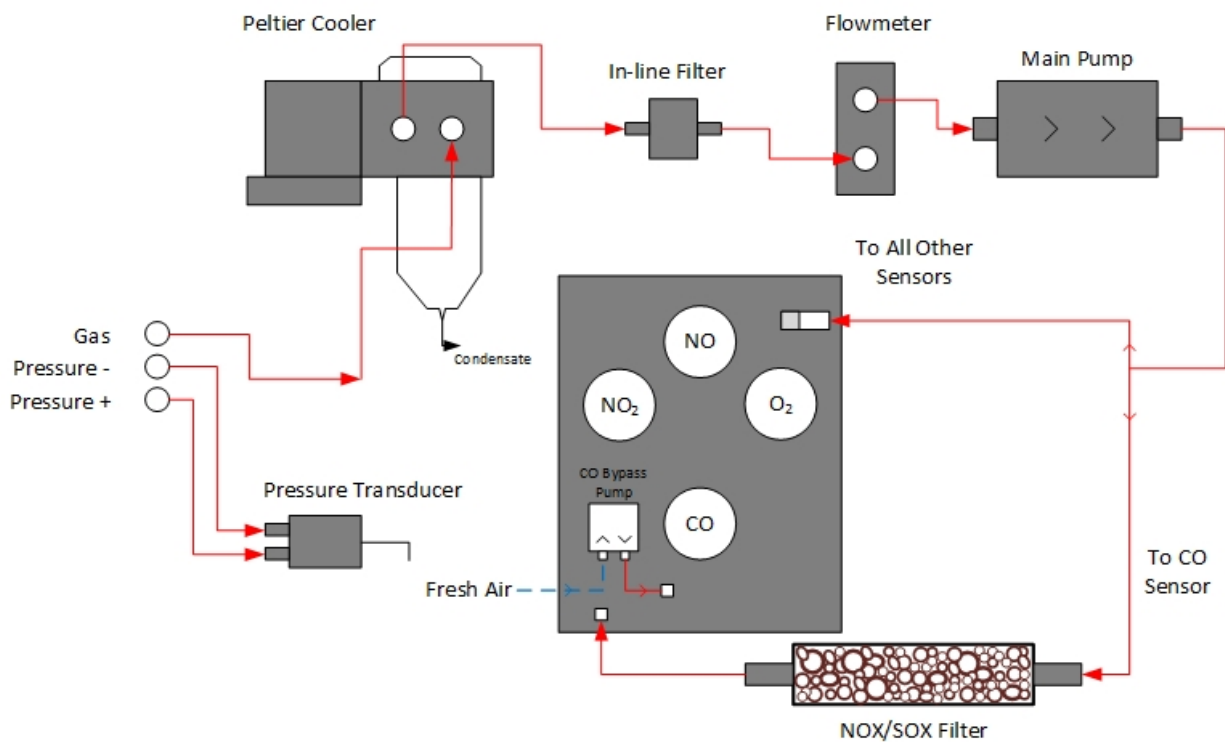

The engine is started from Enchanted Rock's operation center (i.e., the NOC) and allowed to be warmed up for approximately ten-minutes before testing begins. Next, the technician centers the shepherd's hook in the two exhaust pipes and begins the emissions test cycle. Each test cycle consists of a ramp period, a thirty-minute test period, and a 20-minute purge period. The ramp period allows the output from the electrochemical cells to stabilize, and the fresh air purge is needed after each test cycle for proper operation. The duration of the ramp period is identified during the pre-test calibration and typically is around 2-5 minutes in duration.

After the final test cycle is complete, a post-drift check is conducted which follows the same steps as the pre-test calibration. All test data and reports are provided in Appendices A, B, and C.

2.3 Test Specific Conditions

The operation of CHP-01 is currently unable to reach its normal rated capacity of 400 kWe. CHP can balance the host facility's load and is able to export limited amounts of power to the ERCOT grid. The normal operating load of the genset was found to be around 77% at the time of the test. The genset's interactive display provides information regarding the genset's load, operating hours, and any messages that may be present in the ECU and was used to identify the load at the time of the test.

Although the power output from the generator is typically stable, there is some variability in the operating level throughout the test. Enchanted Rock has conservatively calculated emissions from the genset based on operations at 77% load for the duration of the test.

SECTION 3 - EMISSIONS CALCULATIONS

This section describes the air emission calculation methodologies used to estimate hourly emission rates for the sampled during the initial compliance test. The Testo 350 emission analyzer reports emissions in parts per million by volume (ppm). Enchanted Rock uses the Testo built in datalogger to automatically capture test data then uses a separate spreadsheet to generate a report and calculate the mass emission rate for the compounds sampled. The methodology for calculating each emission rate is presented in this Section, along with the unit-specific parameters that were used to estimate these emission rates.

3.1 Engine Parameters

Engine operating parameters are calculated based on the engine load identified during the emissions test. The load is typically steady but may increase or decrease slightly during the test. The calculated emission rates assume the load identified remained constant for the test duration. Emission rates are estimated based on the engine parameters provided in Table 3-1.

Table 3-1 Engine Parameters

Parameter	Units	Test Value
Engine Load	%	77
Engine Speed	rpm	1,800
Engine Power	hp	502
Engine Fuel Use	SCFH	4,290
Fuel Heat Content (HHV)	Btu/SCF	1,019

3.2 Analyzer Calibration Data

ASTM D-6522 calls for the emissions analyzer calibration to be checked prior to beginning the emissions test and again following the tests. The results of the pre-test and post-test span measurements and the % drift found are provided in Table 3-2. Measurement drift most frequently occurs on the CO electrochemical cell, while the NO and NO₂ cells tend to be stable for the tests. Drift is calculated based on the pre-test and post-test measurements as shown in Equation 1.

Equation 1 – Drift %

$$\text{Drift (\%)} = \frac{(\text{Post Test Span} - \text{Pre Test Span})}{\text{Pre Test Span}} \times 100\%$$

3.3 Mass Emission Calculation

NO_x and CO emissions are calculated using EPA Reference Method 19 at 68 degrees Fahrenheit and 14.696 psia. The emission analyzer measures the raw concentration of NO, NO₂, and CO in the exhaust stream. NO_x emissions are represented as the sum of the NO and NO₂ emissions. The average of the raw concentration from each test is then corrected using the pre-test calibration and post-test drift data to get the overall corrected concentration provided in Table 3-3. Equation 2 is used to calculate the calibration corrected concentration. The corrected concentration is used in Equations 3 and 4 to calculate the hourly mass emission rate for NO_x and CO, using EPA Method 19, the associated molecular weight, and f-factor for natural gas combustion, which is then compared against the limits in Chapter 117 and the facility's air permit.

Equation 2 – Calibration Corrected Concentration

$$C_{CORR} = (C_{MEAS} - C_{CZ}) \times \left(\frac{C_{CAL}}{C_{CM} - C_{CZ}} \right)$$

Equation 3 – Mass Emission Rate (g/bhp)

$$\begin{aligned}
 &M_{CORR}(g/bhp) \\

 \end{aligned}$$

Equation 4 – Mass Emission Rate (lb/hr)

$$M_{CORR}(lb/hr) = \left(\frac{C_{CORR}}{10^6} \right) \left(\frac{8710 \text{ dscf}}{MMBtu} \right) \left(\frac{\text{Fuel Use} \left(\frac{scf}{hr} \right) \times HHV \left(\frac{Btu}{scf} \right)}{10^6} \right) \\ \times \left(MW \frac{lb}{lbmol} \right) \left(\frac{O_{2 \text{ Std}} - O_{2 \text{ Ref}}}{O_{2 \text{ Std}} - O_{2 \text{ Act}}} \right) \left(\frac{1 \text{ lb}}{385.5 \text{ scf}} \right)$$
